

WHAT IS CLAIMED IS:

1. A gas turbine power generation system, comprising:  
a single-spool gas turbine engine having a turbine and a compressor coaxially  
connected to the turbine,  
5 an air intake duct that supplies intake air to the engine;  
a generator connected to a rotating shaft of the engine,  
a housing that houses the engine, the air intake duct and the generator and is  
formed to be a box-like shape having at least two openable maintenance faces; and  
a partition that divides interior space of the housing into two regions in vertical  
10 direction into an upper bay and a lower bay such that the engine is installed in the  
upper bay and the air intake duct is installed in the lower bay at a location directly  
under the engine.
- 15 2. A system according to claim 1, wherein the two openable maintenance faces  
of the housing are a top face and a face that lies parallel to the rotating shaft of the  
engine.
- 20 3. A system according to claim 2, further including an exhaust duct that  
exhausts combustion gas discharged from the engine to outside of the housing, and the  
exhaust duct is installed in the upper bay of the housing at a location near a face that is  
opposite, relative to the engine, to the face that lies parallel to the rotating shaft of the  
engine.  
25
4. A system according to claim 1, further including an electrical unit that is  
electrically connected to the generator, and the electrical unit is installed in the lower

bay of the housing at a location under the air intake duct.

5        5. A system according to claim 4, further including a cooler that cools the electrical unit by external air.

10       6. A system according to claim 1, further including a fuel supplier that supplies fuel to the engine and a cooler that cools the fuel supplier by external air, and the fuel supplier and the cooler are installed in the lower bay of the housing.

15       7. A system according to claim 1, wherein the housing is formed with grooves at its bottom face that receive forks of a forklift.

20       8. A gas turbine power generation system, comprising:  
a single-spool gas turbine engine having a turbine and a compressor coaxially connected to the turbine,  
an air intake duct that supplies intake air to the engine;  
a generator connected to a rotating shaft of the engine, and  
a housing that houses the engine, the air intake duct and the generator and has an openable maintenance face;  
wherein:  
25       the air intake duct includes:  
a duct section that has an air inlet at a plane coincident with that of the openable maintenance face; and  
a filter-housing section that detachably houses an air filter for cleaning the

intake air.

9. A system according to claim 8, wherein the duct section and the  
5 filter-housing section are airtightly joined such that the air intake duct can be taken out  
through the openable maintenance face as a single unit.

10. A system according to claim 8, wherein the duct section is formed to be a  
10 structure that changes flow direction of the intake air at least once when the intake air  
flows from the air inlet to the filter-housing section.

11. A system according to claim 8, further including:  
15 a divider that divides interior space of the housing into two regions into an  
upper bay and a lower bay such that the engine is installed in the upper bay and the air  
intake duct is installed in the lower bay, and  
an air intake passage provided in the divider such that the intake air passes  
through the air filter of the air intake duct to the engine.

20

12. A system according to claim 11, wherein the air intake passage is formed to  
be a structure that changes flow direction of the intake air at least once therein.
